27

28 **Condensation:** OBGYNs must combat the unprecedented and unanticipated restrictions on reproductive
29 healthcare introduced during the COVID-19 pandemic.

30

31 **Short Title:** Advocating for reproductive healthcare during COVID-19

32

33

34

35 **Abstract**

36 The COVID-19 pandemic has redefined 'essential care', and reproductive healthcare has become a
37 frequently targeted and debated topic. As Obstetricians and Gynecologists (OBGYN), we stand with our
38 patients and others as advocates for women's reproductive health. With the medical and surgical
39 training to provide all aspects of reproductive healthcare, OBGYNs are indispensable and uniquely
40 positioned to advocate for the full spectrum of care that our patients need right now. All patients have a
41 right to these services. Contraception and abortion care remain essential, and we need to work at the
42 local, state and federal level on policies that preserve these critical services. We must also support
43 policies that will promote expansion of care, including lengthening Medicaid pregnancy/postpartum
44 coverage. While we continue to see patients, this is the time to engage outside clinical encounters by
45 participating in lobbying and other advocacy efforts to preserve essential services, protecting the health,
46 life, and welfare of our patients during COVID-19.

47

48 Key words: abortion access, contraception, COVID-19 pandemic, obstetrics and gynecology,
49 reproductive health, women's health

50

51 **Introduction**

52 COVID-19 poses an unprecedented health and social crisis. Due to the massive strain placed on the
53 healthcare system, a critical need exists to preserve resources. Varying restrictions are appropriately in
54 place, limiting medical care based on regional disease impact and by recommendations from bodies
55 such as The American College of Obstetricians and Gynecologists (ACOG).¹ “Essential” and “elective” are
56 the terms used to determine what procedures are preserved. By categorizing time-sensitive
57 reproductive health procedures (i.e. abortion), as “non-essential”, several states have limited women’s
58 reproductive health choices. The status of other procedures, such as sterilization and long-acting
59 reversible contraception (LARC) insertions or removals, have been debated and restricted during the
60 crisis. The maneuvering to impose barriers to women’s reproductive autonomy during this time will
61 impact vulnerable groups even more.

62
63 As OBGYNs, we occupy a powerful space at the crossroads of politics, social justice, and reproductive
64 rights. This is a call to action for OBGYNs to fight for the preservation of reproductive healthcare. Our
65 call to action highlights areas under threat with concrete solutions to preserve and improve women’s
66 reproductive health.

68 **Abortion Care during the COVID-19 Pandemic**

69 **Medication Abortions: Reduce barriers**

70 In a 2020 joint statement of leading women’s health organizations, abortion is affirmed to be a time-
71 sensitive procedure to which access must be preserved.² With “no-test” protocols, appropriate patients
72 at less than 77 days of gestations, are able to access evidence-based, safe medication abortion without
73 in-person visits. This translates into a large percentage of patients receiving remote care entirely. These
74 “no-test” protocols keep appropriate abortion patients out of clinics and hospitals, minimize the use of

75 PPE, and maintain social distancing measures. Bans and restrictions on medication abortions are
76 politically motivated, and not based in science. We call on the OBGYN community to fight against recent
77 efforts to restrict abortion and advocate for the removal of current state laws (i.e. waiting periods,
78 mandatory two-visit medication abortion protocols) that place patients and health care workers at
79 increased risk.

80

81 **Procedural Abortions**

82 During this pandemic, when hospital resource preservation is paramount, procedural abortions in the
83 outpatient setting are a low cost and safe option with minimal PPE utilization. Labeling abortion as a
84 “non-essential” procedure limits access, delays care, and unnecessarily increases the risks to maternal
85 health. Understanding regional healthcare limitations, we advocate that outpatient facilities obtain and
86 maintain the ability to perform procedural abortions. With outpatient abortion access maintained,
87 hospital-based procedural abortions are appropriately limited to the most medically complex patients.

88

89 **Contraceptive Services during the COVID-19 Pandemic**

90 **Permanent Contraception: the role of Medicaid Extension**

91 Postpartum care provides critical services encompassing contraception, mental health, lactation
92 support, and management of chronic diseases. Currently, Medicaid covers more than 40% of all births in
93 the United States, but for women with pregnancy-related Medicaid, coverage typically lapses after 60
94 days.³ With this in mind, ACOG advocates for Medicaid extension to cover 12 months postpartum with
95 comprehensive care to decrease maternal morbidity and mortality in this period.³ While ACOG
96 leadership felt this was critical prior to the COVID-19 pandemic, the national emergency that ensued
97 highlights the importance of this proposal.

98

99 Prior to the pandemic, almost 50% of women desiring permanent sterilization during their delivery
100 admissions would not undergo the procedure⁴ and now this number is likely higher with fewer cases
101 (postpartum and interval sterilization procedures) being performed. Even with current limitations of
102 resources and PPE, postpartum sterilization remains a time-sensitive, essential procedure that should be
103 completed to support the reproductive autonomy of our patients.⁵ Failing to provide this procedure due
104 to the misclassification as “elective” minimizes reproductive choice and does not acknowledge that
105 contraception is even more essential during a time of systemic stress with an uncertain economic future.

106
107 Regrettably, if Medicaid coverage lapses or Title XIX consent forms expire during the pandemic, many
108 women will lose their opportunity to obtain a desired sterilization procedure. Fortunately, the Centers
109 for Medicare & Medicaid Services (CMS) has announced the suspension of all reverification during the
110 COVID-19 crisis, and coverage will continue for now.⁶ We must advocate for expedited access to all
111 contraceptive options. When a patient is unable to receive a desired method due to necessary COVID-19
112 restrictions, providers need to educate and counsel about alternate contraceptive methods to prevent
113 this pandemic from leading to more short-interval, and potentially undesired, pregnancies.

114

115 **Immediate Postpartum Long-acting Reversible Contraception Insertion**

116 Immediate Postpartum (IPP) LARC is the placement of an intrauterine device or implant during a delivery
117 admission. IPP LARC is safe, effective, and well supported by data and patient satisfaction. Facilitating
118 IPP LARC would benefit patients, providers, and institutions, especially during a time when outpatient
119 visits are limited. The lack of reimbursement from private payers is a significant barrier for many
120 women. Now is the time to demand simple guidance for payment from all insurance providers. IPP LARC
121 should be an option for all women following delivery, preserving it where existing and implementing it

122 at hospitals not currently offering it, as it requires no additional PPE and COVID-19 is not a
123 contraindication.

124

125 **Continue to Offer Outpatient Contraceptive Management**

126 LARC is highly effective with typical use and has few medical contraindications. LARC use continues to
127 increase, and in populations where its use is widespread, unintended pregnancy and abortions have
128 decreased. Fortunately, contraception counseling is appropriate for virtual or in-person encounters.
129 When a patient desires to have a LARC insertion or removal, and the region is able to accommodate
130 outpatient visits, LARC visits need to occur. We must advocate and create protocols for health care
131 practices to minimize exposure during a LARC procedure. If LARC placement is unavailable or undesired,
132 it is imperative to provide user-controlled methods of contraception (e.g. pill, patch, and ring) and
133 emergency contraception as desired. Refills and new prescriptions for short-acting methods can occur
134 safely by utilizing telemedicine. Preserving access to all contraceptive options will decrease unintended
135 pregnancies and abortions.

136

137 **Conclusion**

138 Optimization of current standards of practice and elimination of barriers to postpartum and outpatient
139 LARC and sterilization are essential, as is the preservation of abortion care in this unprecedented COVID-
140 19 era. Our patients' reproductive autonomy depends on our commitment to both safely providing
141 these services and advocating for their availability at the health-system, local, state, and national level.
142 Postpartum sterilization procedures and access to abortion are always time-sensitive and essential. The
143 indefinite postponement of postpartum sterilization and the absence of IPP LARC programs frequently
144 leads to hospital discharge without contraception and future unintended pregnancy. Especially during
145 the COVID-19 pandemic, we must dedicate our work and advocacy to eliminating barriers to healthcare

146 resources, such as mandating unnecessary visits to facilities, regulations against telehealth, and abortion
147 waiting laws. Failing to provide our patients effective contraception and then forcing women to carry
148 undesired pregnancies to term during a medical pandemic and social crisis is immoral. As reproductive
149 health physicians and advocates, we need to “make our voices heard” to ensure access to essential
150 healthcare and preservation of reproductive autonomy.
